

Welcome to Grand Park Auto

Grand Park Auto is a car parking simulator that simulates the daily operation of a real parking facility. Cars arrive, enter through gates, park, make payments, and leave. The simulator also includes components such as **Parking Spots, Barrier Gates, Lights, Exhaust Fans, and Entry/Exit Spots.**

Your team will build the **system that manages this car park.** Think of your system as the parking control center: the simulator tells you what is happening, and your system decides what to do next.

The simulator sends events to your system through **Webhooks.** Your system sends commands and requests back through a **secure REST API.** For example, when a car arrives, your system may choose a parking spot, open the gate, and guide the car to best spot.

As the challenge progresses, things become more difficult. Components may break, cars may behave unexpectedly, maintenance will be required, traffic will increase, Rider are angry, and other situations will test your system.

Your mission is to build a smart, reliable system that can manage the car park and keep it running smoothly.

How To Start
